### **Outline**

### **Outline**

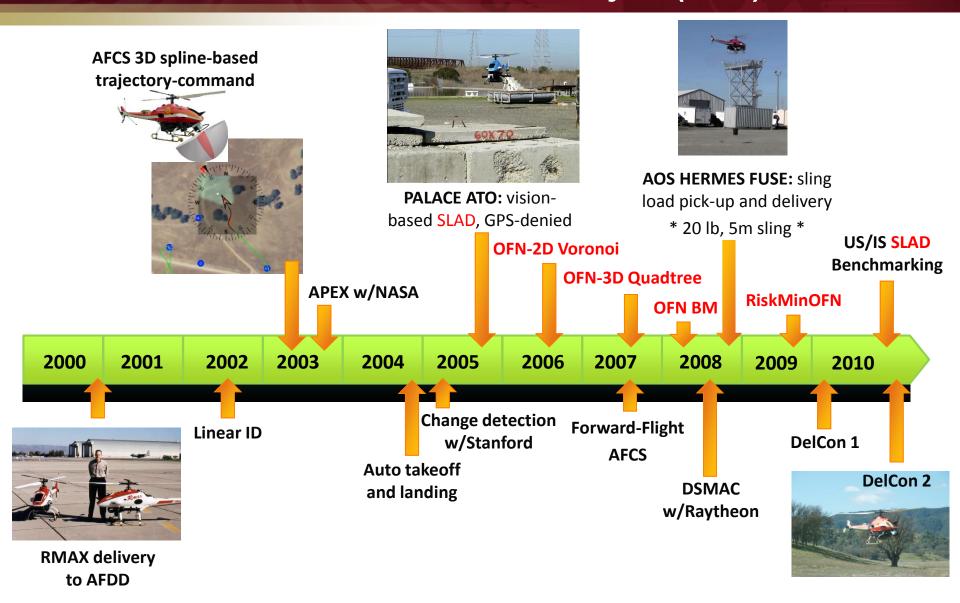

### **ARP Background** Autonomous Research Project (ARP) AMRDEC

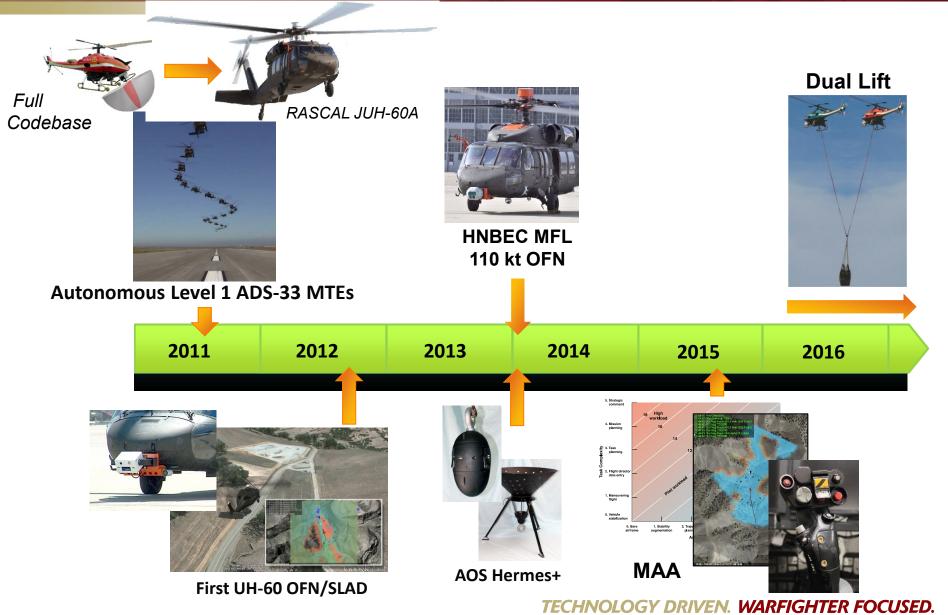

### **ARP Background** Autonomous Research Project (ARP)

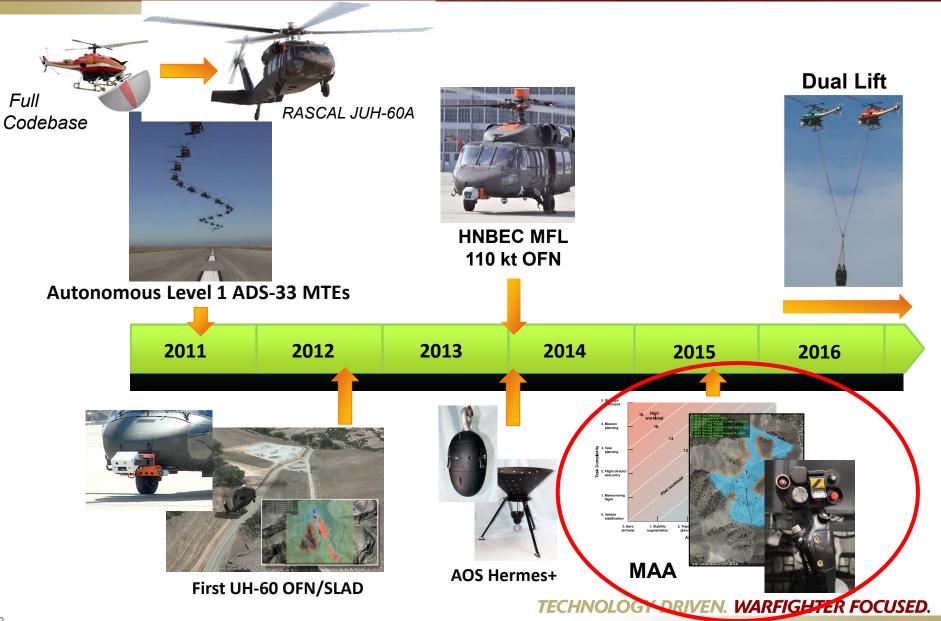

### **ARP Background** Autonomous Research Project (ARP)

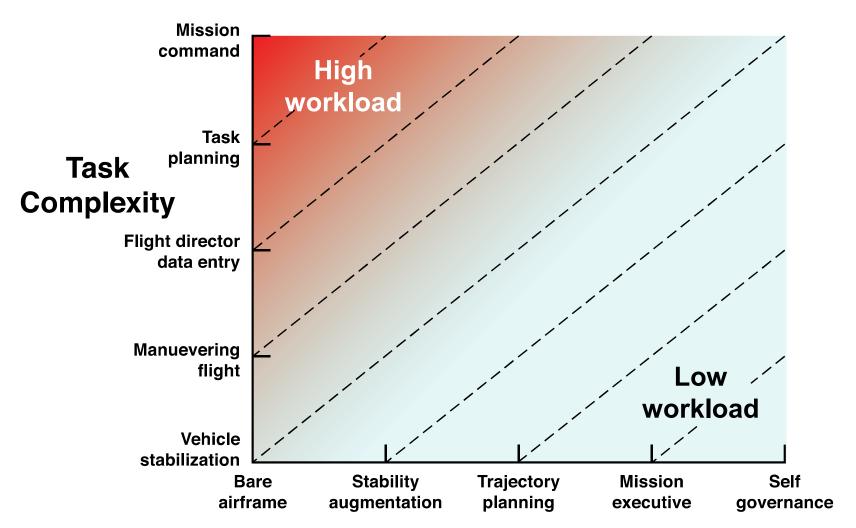

### **Outline**

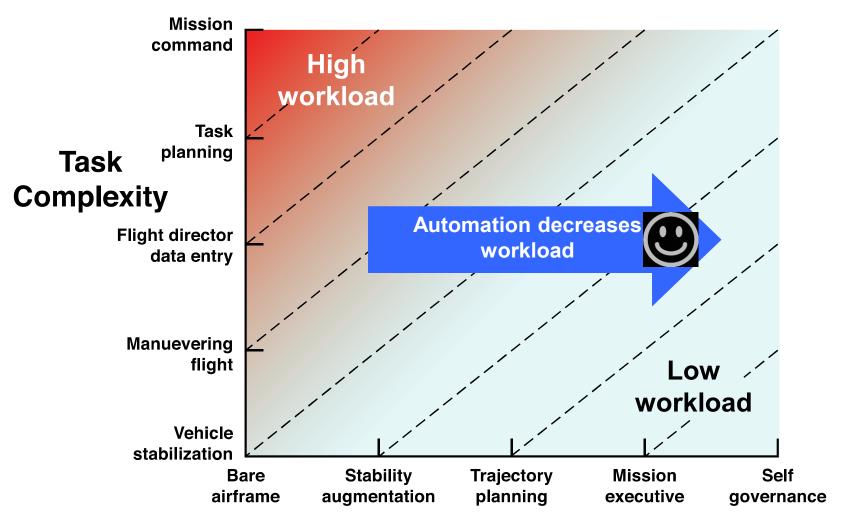

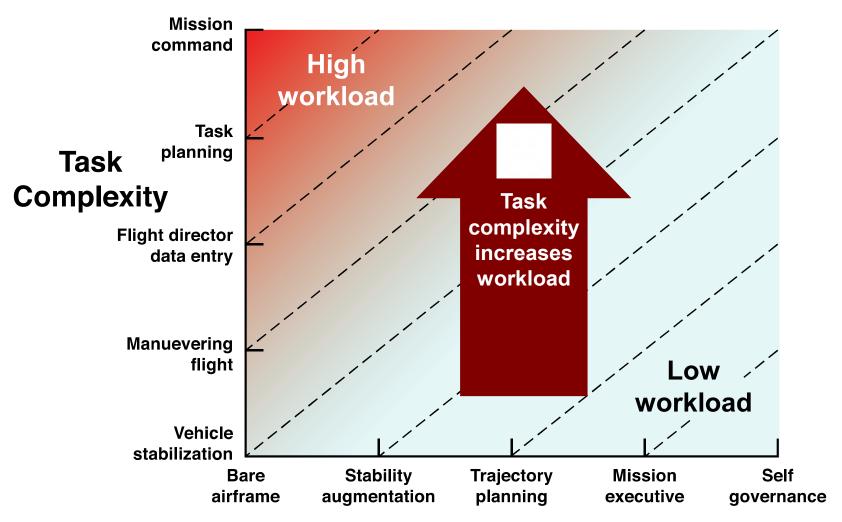

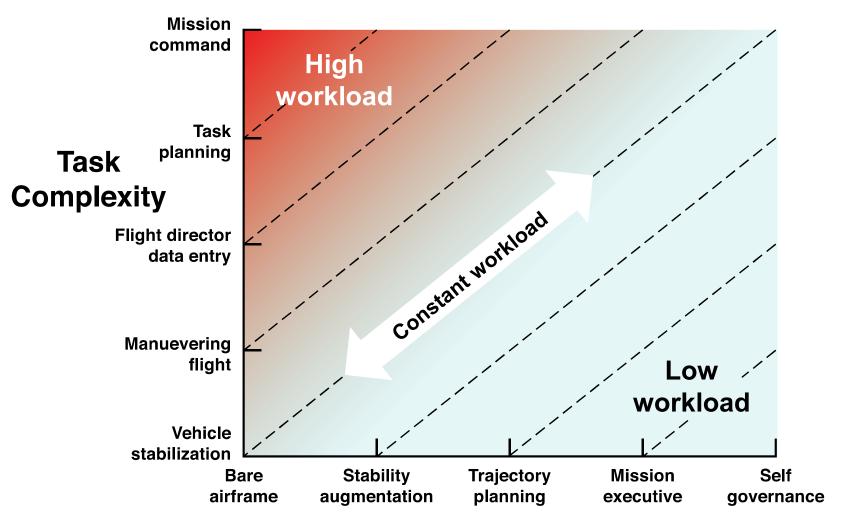

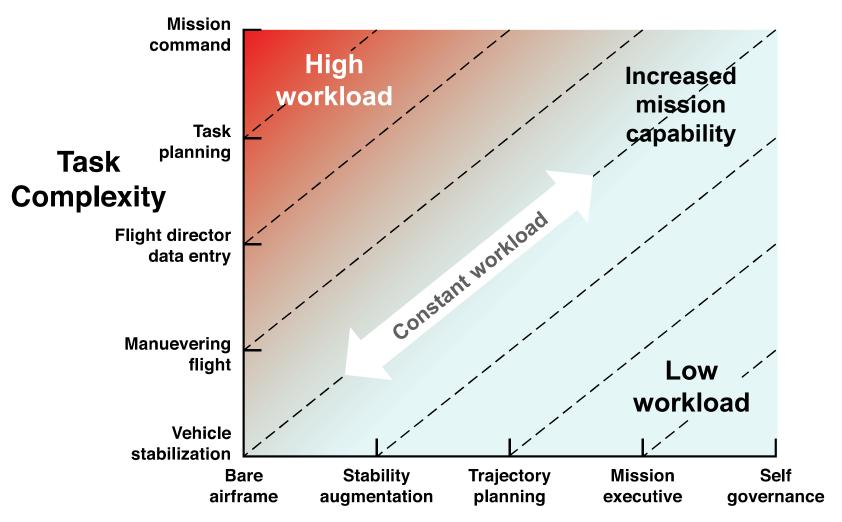

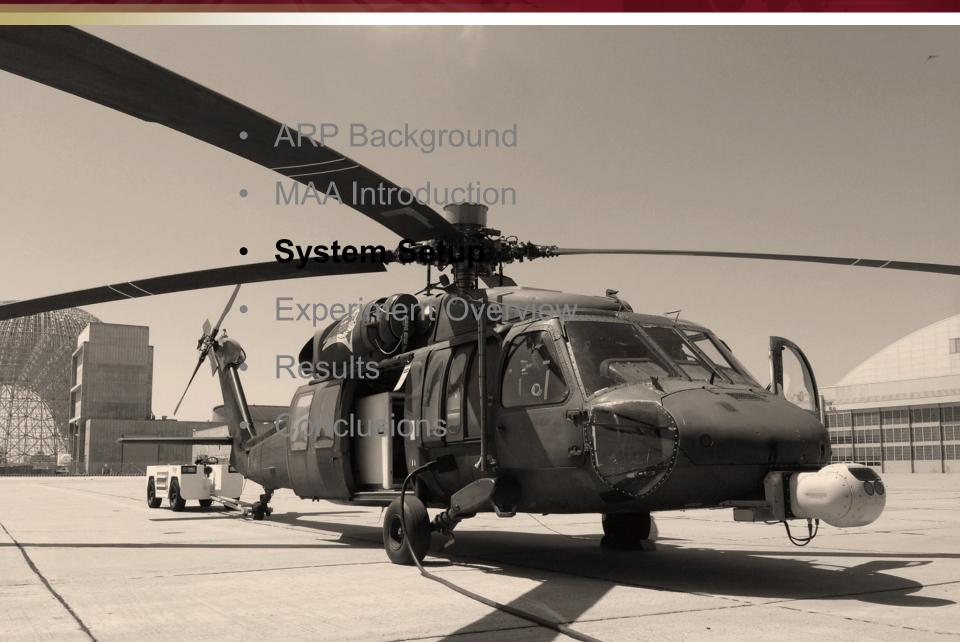

### **Test Objective:**

Evaluate MAA concept – enable pilots to select the automation they need to meet the mission demands.

### **Outline**

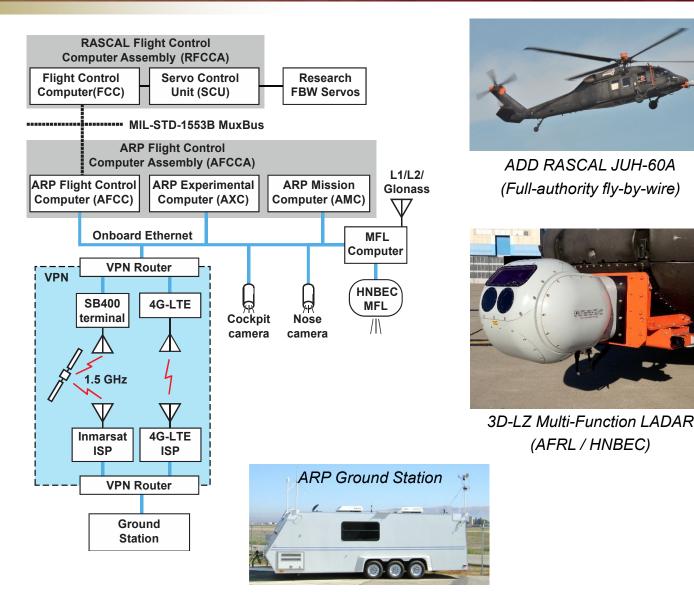

## System Setup MAA System on RASCAL

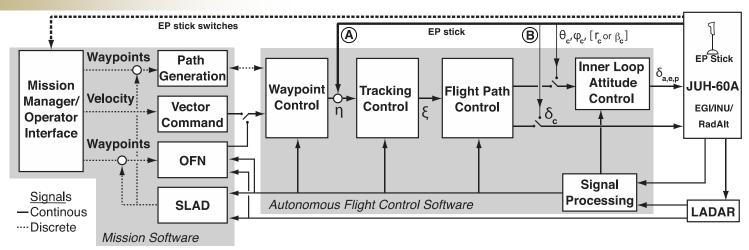

### System Setup Autonomous Flight Control System

#### Autonomous Flight Control Software

— Signal Processing: Filters and estimates states

— Inner Loop Attitude: ACAH response

— Flight Path Control: Aircraft oriented velocity command in hover and forward flight modes

Tracking Control: Track inertial path with hover and forward flight modes

Waypoint Control: Convert commanded trajectories into continuous steam for tracking

Additive control at A

Decouple to ACAH at B

• Driven by Mission Manager Software

— Path Generation: Fixed, pre-defined waypoint paths

Vector Command:Velocity vector commandOFN:Obstacle Field Navigation

— SLAD: Safe Landing Area Determination

### System Setup Kisk-Minimizing Obstacle Field Navigation AMRDEC

#### 1. LADAR scans forward region

#### 2. Real-time continuous 3D risk map is constructed

- Terrain (LADAR), threats, no-fly zones, desired AGL, loss of aircraft
- 3D space classified as empty, full, or unknown using statistical error model

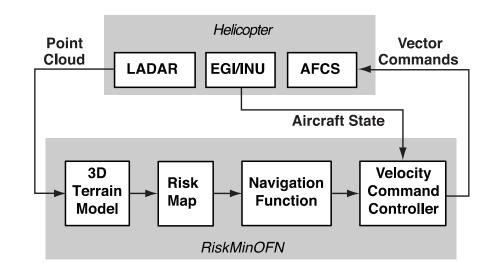

#### 3. Navigation function applied to array

- Distance transform
- 3D A\* algorithm calculates a navigation function; ~ 5 sec cycle

#### 4. Velocity command generated at 5Hz

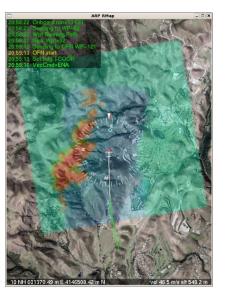

RiskMinOFN "always on"; updates the onthe-fly; adaptive

- Destination, speed
- Risk function parameters
- 3D array resizing

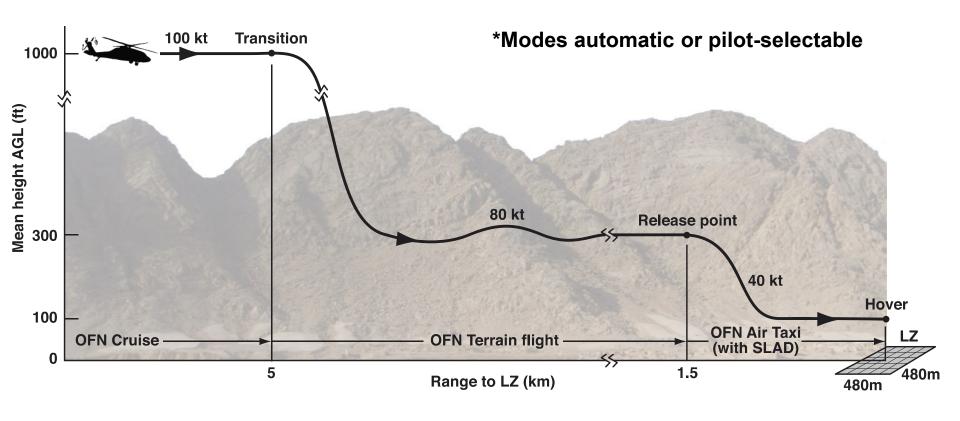

HNBEC MFL

### System Setup MAA Enroute and Approach Modes

### **System Setup** Multi-Layer Surface Map (MLSM)

Absolute edge Differential edge

No data

#### 1. LADAR scans landing zone

#### 2. Real-time continuous height map construction

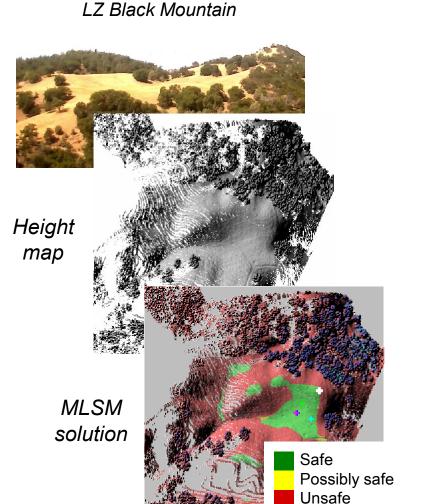

- Scan registration for height/roll bias and time drift

$$J(h,d) = \sum \frac{[(h+dt_i) + H_i - Z_i]^2}{D_i^2}$$

- Height statistics accumulated using differential and absolute error model
- Individual Kalman filter for each cell

#### 3. Map evaluation

- Slope and roughness
- Edge and obstacle detection
- Landing zone classified safe/unsafe
- Optimal landing points
- 4. Keep data for subsequent solutions

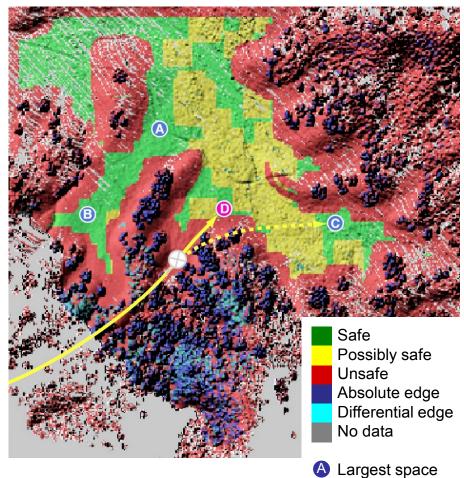

TECHNOLOGY DRIVEN. WARFIGHTER FOCUSED.

## System Setup MAA Approach Sequence

- 1. Scan landing zone during approach
- 2. Display MLSM solution
- 3. Automatically send landing point A to navigation system\*
- 4. Pilot can select alternate landing point if desired
- 5. Iterate solution every 5 seconds
- \* First solution only retain previous landing point unless found to be invalid

## System Setup MAA Input

### Set destination and flight mode

Push to couple/decouple Set flight speed (coupled) Stick trim (ACAH)

Change landing point

## System Setup MAA Displays

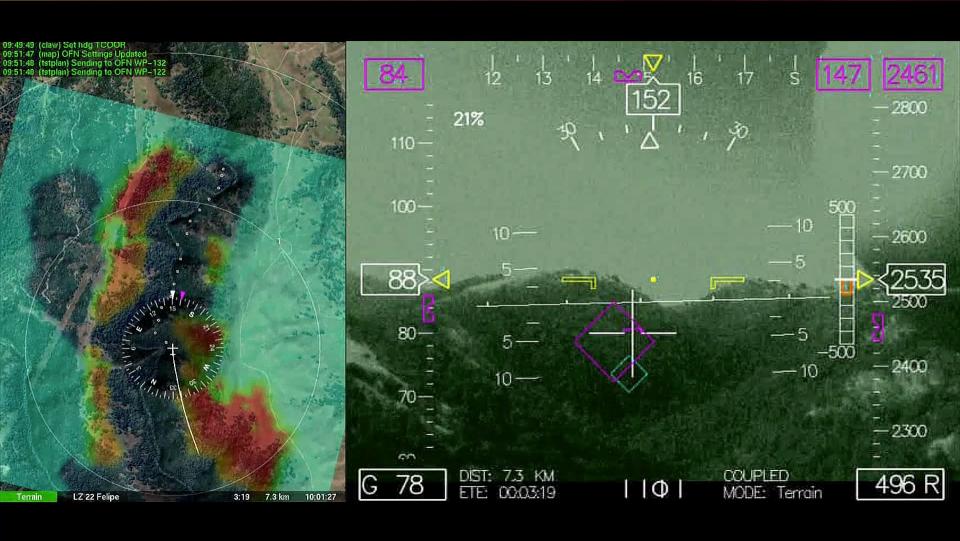

## System Setup Enroute Guidance Symbology

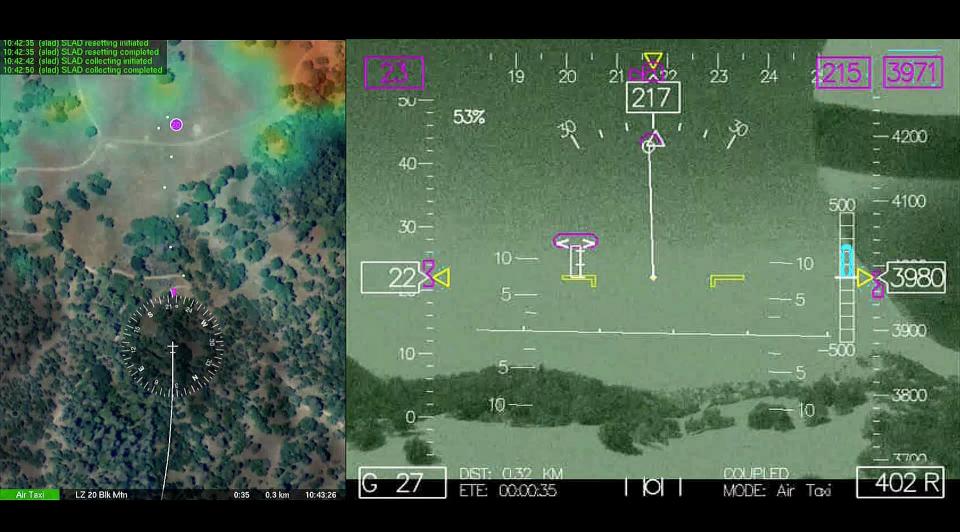

# System Setup Approach Guidance Symbology

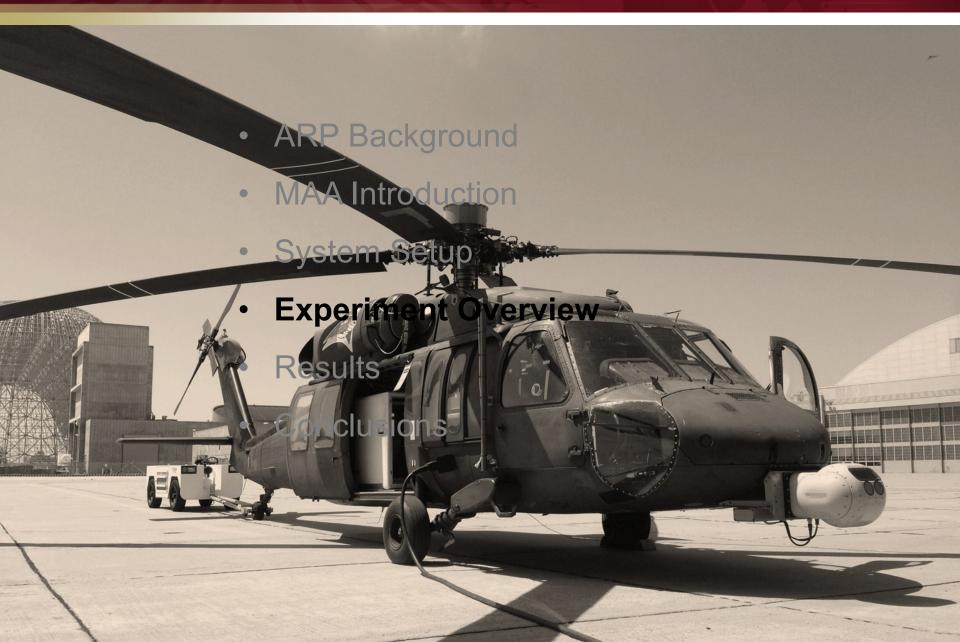

### **Outline**

### **Experiment Overview**

- Leverage prior ADD autonomy work
- Add MAA selectable features
- Add display guidance
- Fly utility mission scenarios
- Use filtered NVGs + mask to achieve degraded visual environment (DVE)
- Collect pilot opinion, performance data, workload ratings

RASCAL JUH-60A

Simulated DVE

# Experiment Overview Three Test Configurations

#### **Configurations**

#### **Baseline**

Control	ADS-33 Level 1 ACAH	X
Display	Primary flight display	X
Selectable Features	Set Flight Mode/Speed	
	Change Landing Point	
	Set Destination	
	Control Coupling (autopilot)	
	Additive Control	

# Experiment Overview Three Test Configurations

### **Configurations**

		Baseline	Display- Only MAA
Control	ADS-33 Level 1 ACAH	X	X
Display	Primary flight display	X	X
	MAA guidance		X
Selectable Features	Set Flight Mode/Speed		X
	Change Landing Point		X
	Set Destination		Х
	Control Coupling (autopilot)		
	Additive Control		

# Experiment Overview Three Test Configurations

		Baseline	Display- Only MAA	Full MAA
Control	ADS-33 Level 1 ACAH	x	X	X
Display	Primary flight display	X	X	X
	MAA guidance		X	X
Selectable Features	Set Flight Mode/Speed		X	
	Change Landing Point		X	
	Set Destination		X	
	Control Coupling (autopilot)			
	Additive Control			

## **Experiment Overview Mission Scenarios**

- Depart Moffett NUQ to the east
- Base radios mission description
  - Pick up troops, materials
- Proceed to first destination
- Base introduces secondary tasks
  - SITREP
  - Site RECON
  - Time-on-station estimate
  - Radio relay
  - Copy popup threat coordinates
  - Workload ratings
- Multiple mission segments
- Return to Moffett NUQ

### **Outline**

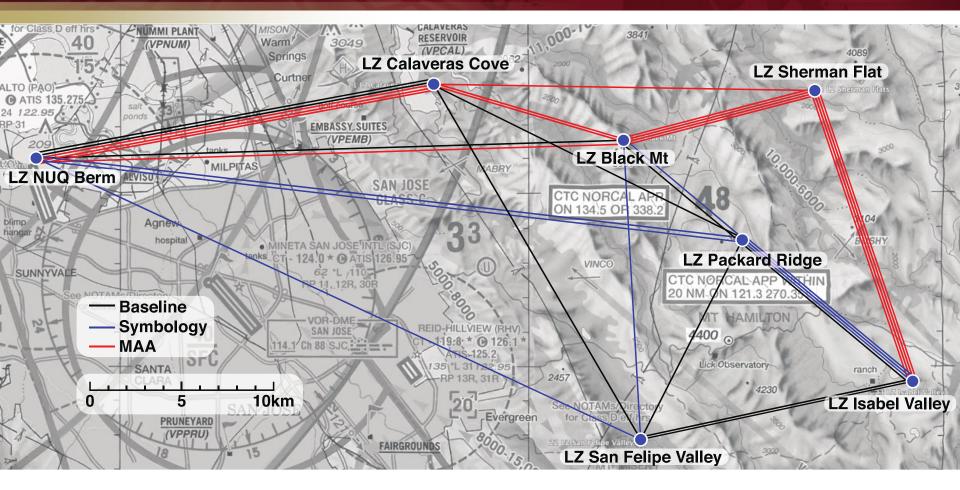

#### **Routes Flown**

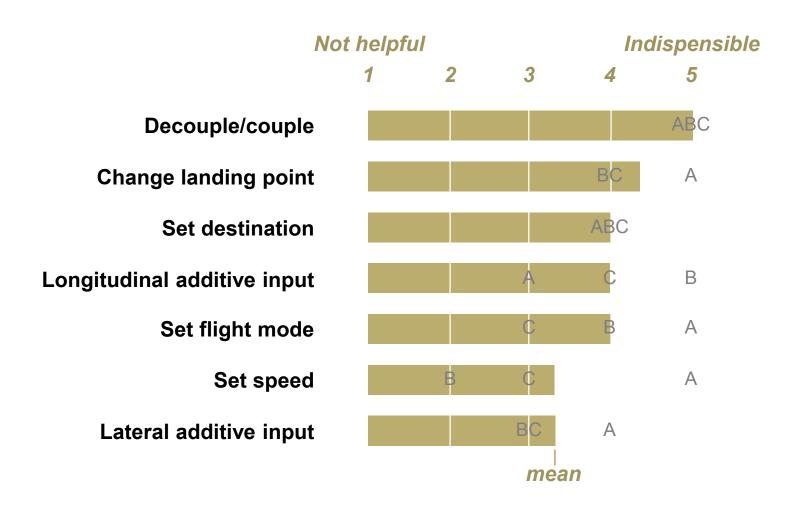

- 1000+ km flown during development & test
- 90 approaches at 7 locations
- 3 Army XPs (data) + Army XP + Air National Guard pilot

#### **Feature Desirability**

\*ABC = post-experiment ratings given by three pilots

#### **Display/Guidance Results**

#### Input

- Destination/flight mode input easy
- Pilots suggested a freeform destination input

#### **Enroute Guidance**

- SPI and blue diamond significantly enhanced predictability and trust
- Manually piloting Display-Only possible but high workload; implied more precision than really required
- Speed guidance for Display-Only should distinguish between too slow and too fast – too fast is a safety concern

#### **Landing Guidance**

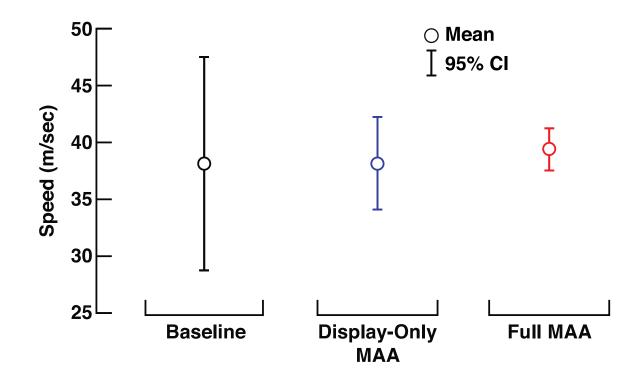

- Pilots suggested MLSM results in forward window
- Pilots suggested preselected criteria for LPs to reduce workload on approach

### Performance Results Enroute Speed

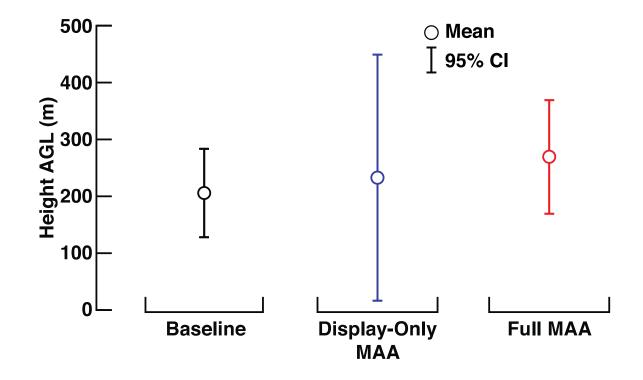

# Performance Results Enroute Altitude

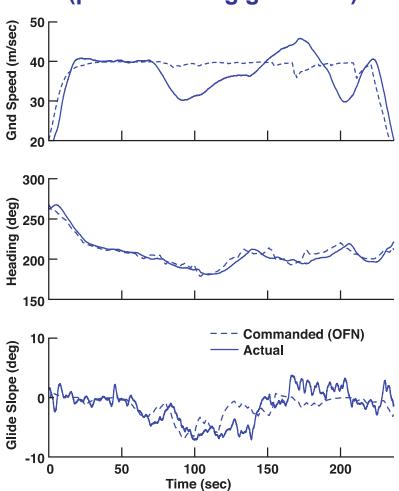

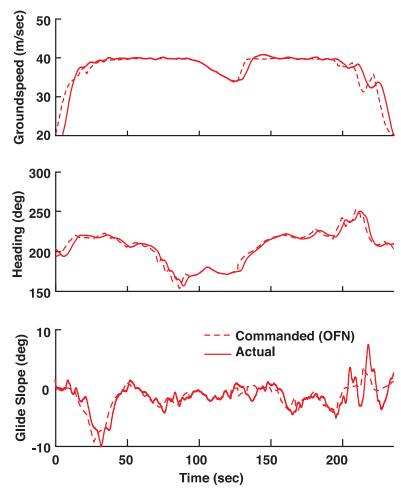

#### Piloted vs. Auto

### Display-Only MAA (pilot following guidance)

### Full MAA (coupled AFCS)

### Workload instantaneous Self-Assessment (ISA) AMRDEC

ISA	Workload	<b>Spare Capacity</b>
5	Excessive	None
4	High	Very Little
3	Comfortable	Some
2	Relaxed	Ample
1	Underutilized	Very much

**Pro –** correlates well with post-test assessment; e.g. TLX\*

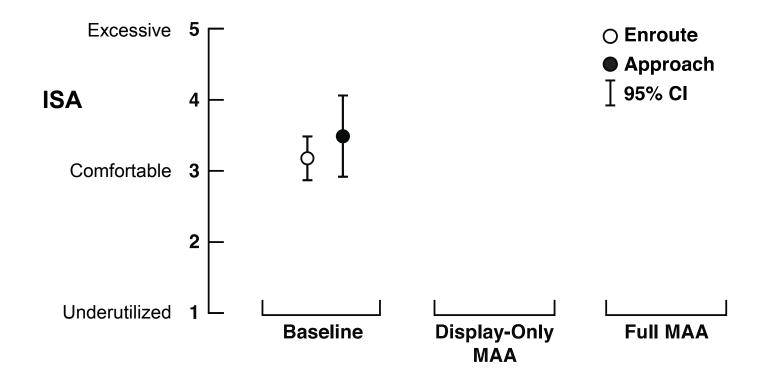

**Con –** assigning ISA <u>adds workload</u>; acceptable since we we wanted secondary tasks

<sup>\*</sup>Tattersall, A. J., and Foord, P. S., "An experimental evaluation of instantaneous self- assessment as a measure of workload," Ergonomics, 39(5), 740-748, 1996.

### Workload Thstantaneous Self-Assessment (ISA)

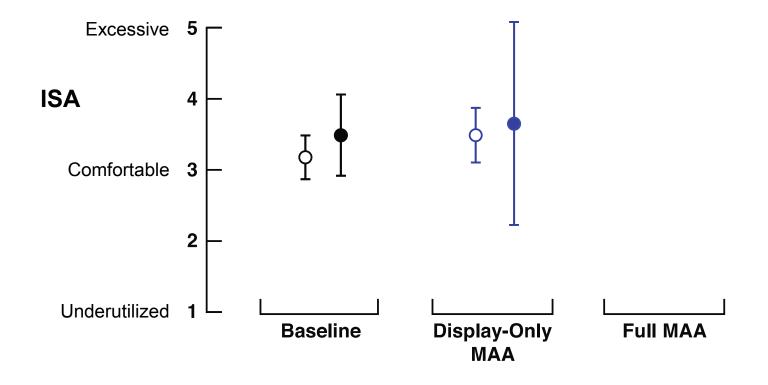

### Workload Thstantaneous Self-Assessment (ISA)

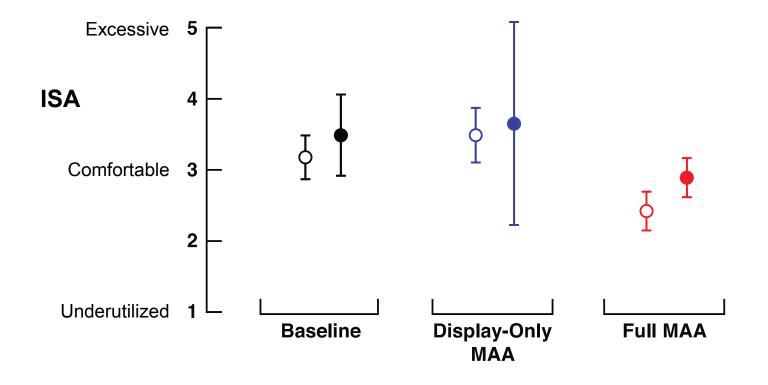

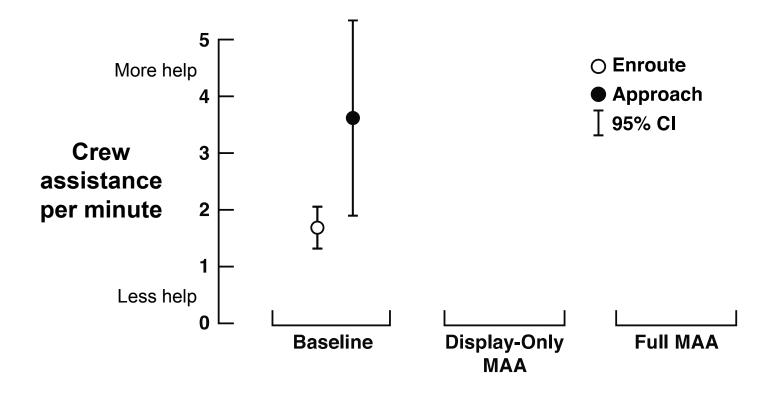

### Workload Thstantaneous Self-Assessment (ISA)

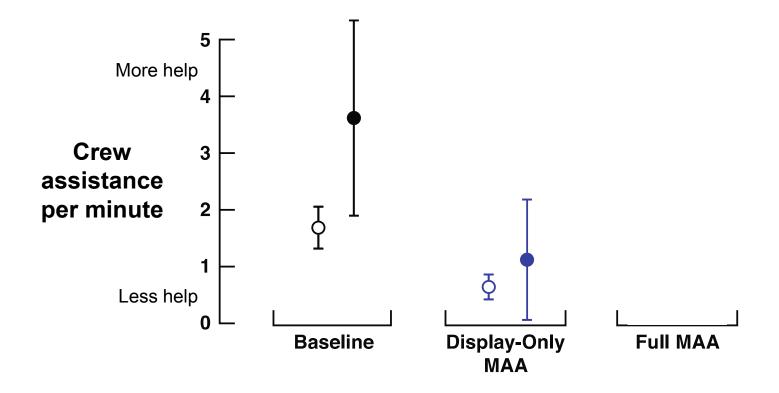

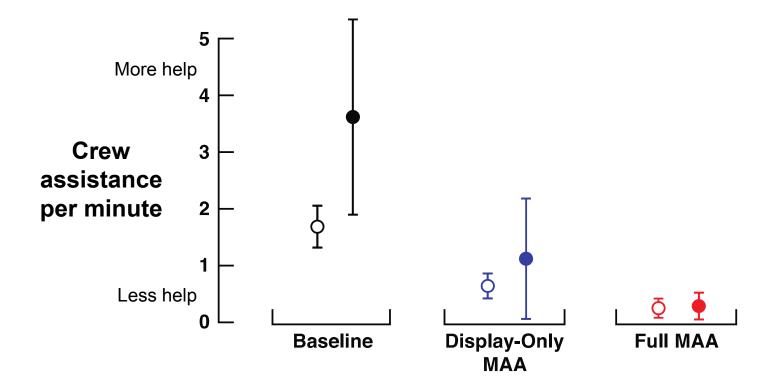

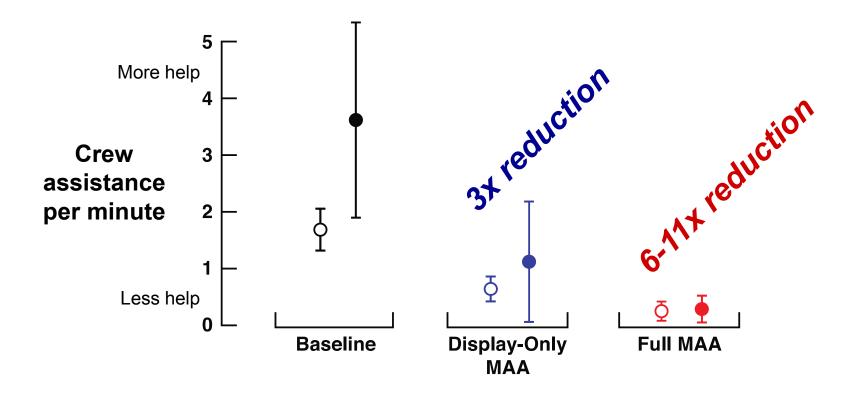

### **Outline**

#### Conclusions

- MAA system integrated and flown on RASCAL JUH-60A
- MAA decreased workload thus increasing spare capacity
- MAA feature utility varied:
  - Good: Decouple/couple, Change landing point
  - Fair: Set destination, Longitudinal additive, Set flight mode/speed
  - Needs work: Lateral additive
- Display-Only guidance usable but overly precise
- Display lead cues critical for increasing trust
- Landing point iteration strategy requires careful attention
- Strong crew workload effect:
  - 3x reduction with Display-Only MAA
  - 6x / 11x reduction with Full MAA
